VOYAGER
TO THE OUTER PLANETS AND BEYOND

VOYAGER
TO THE OUTER PLANETS AND BEYOND

Launch Dates: August 20 and September 5, 1977

The twin spacecraft Voyager 1 and 2 flew by and observed Jupiter, Saturn, Uranus and Neptune. Both craft are now heading out of the solar system. In 1998, Voyager 1 became the most distant human-made object in space. Its current mission is to study the region in space where the Sun's influence ends and the dark recesses of interstellar space begin.
